

ABSTRACT OF DISCLOSURE

A computer with a security mechanism, for securing a motherboard and a storage medium drive such as a hard disk, is provided. The computer comprises a chassis, a pan, a first latch, a locking mechanism and a lock. The pan, disposed under the chassis, has the motherboard mounted thereon. The first latch, moveably disposed at the chassis, detachably engages the pan so that the pan combines with the chassis. The hard disk drive is accessibly disposed on the chassis. The locking mechanism is moveably disposed at the chassis to lock the hard disk drive in a separable manner.
